

DAILY STATUS

This dashboard has a simple but powerful function: to compile in a single screen all the unprocessed backlog of the previous day, for each area.

TECHNICAL

Despite the simple appearance, this dashboard required high technical skills. Each area contains a different business rule, a different database and a different data treatment.

Integrations with MS SQL Server, Data Bricks, SharePoint List, Web, Excel Online, etc. were required.

It also required high-level formulas in DAX and several transformations in Power Query

RESULTS

This panel is used every day, at the beginning of each day. The teams involved exchange information about potential bottlenecks in the production process and take proactive actions to avoid problems during the day.
